May 15, 2018

The authors provide valuable causal evidence towards an issue that has been seriously understudied in recent political science. I find their instrumental variables design to be compelling, but I'd like to see more documentation of the first-stage results. Additionally, I think readers could benefit from more descriptive statistics, as well as a substantive focus on the effect size. In particular, could a major legendary Pokémon release event on Election Day have swung the election towards Clinton?
